

C1. Develop a python program to store and display Employee details such as EID, Name, Place, and Department. The EID must be auto-generated for each employee

```
class Employee:
    count = 0

    def __init__(self):
        self.name = None
        self.place = None
        self.department = None

        Employee.count += 1
        self.eid = "EMP" + str(Employee.count)

    def update(self):
        self.name = input("Enter Name: ")
        self.place = input("Enter Place: ")
        self.department = input("Enter Department: ")

    def display(self):
        print("Employee ID:", self.eid)
        print("Employee Name:", self.name)
        print("Employee Place:", self.place)
        print("Employee Department:", self.department)
        print("-" * 30)

# Main Program
n = int(input("Enter the total number of Employees: "))

emp_list = []

for i in range(n):
    print("\nEnter Details of Employee", i + 1)
    emp = Employee()
    emp.update()
    emp_list.append(emp)

print("\nThe Employee Details are:\n")

for emp in emp_list:
    emp.display()
```

Enter the total number of Employees: 2

Enter Details of Employee 1

Enter Name: Ram

Enter Place: Mysore

Enter Department: Finanace

Enter Details of Employee 2

Enter Name: Shyam

Enter Place: Bangalore

Enter Department: Sales

The Employee Details are:

Employee ID: EMP1

Employee Name: Ram

Employee Place: Mysore

Employee Department: Finanace

Employee ID: EMP2

Employee Name: Shyam

Employee Place: Bangalore

Employee Department: Sales
